Autonics

Motor Driver (2-Phase intelligent stepping motor driver) MD2U-ID20

U Ν

Thank you very much for selecting Autonics products. For your safety, please read the following before using.

Caution for your safety

*Please keep these instructions and review them before using this unit.

*Please observe the cautions that follow;

⚠ Warning Serious injury may result if instructions are not followed.

⚠ Caution Product may be damaged, or injury may result if instructions are not followed

*The following is an explanation of the symbols used in the operation manual. ↑ Caution:Injury or danger may occur under special conditions

⚠ Warning

- 1. In case of using this unit with machinery(Nuclear power control, medical equipment, vehicle, train, airplane, combustion apparatus, entertainment or safety device etc), it is required to install fail-safe device. (or contact us for information on type required.)
- It may cause serious human injury or a fire and damage to product
- 2. Installation, connection, operation, control, maintenance should be carried out by person who has been qualified.
- may cause a fire, electric shock or human injury.
- 3. Please use DC power with reinforced insulating the primary and secondary part for the DC power product.
- 4. Please install this unit after considering counterplan against power failure.
- may cause human injury or damage to product by releasing holding torque of motor 5. Do not use this unit outdoors or place where there are flammable, corrosive
- gas, water and too much vibration etc.
- It may cause a fire or give an electric shock 6. Do not put finger or any object into this product.
- may cause a fire or give an electric shock
- 7. Do not disassemble and modify this unit, when it is required, please contact us.
- It may cause a fire or give an electric shock, damage to product. 8. Please use the adjuster with insulated screw driver.
- It may give an electric shock

- 1. Do not move, install, connect or inspect during the operation.
- t may give an electric shock.
- 2. Power input voltage must be used within rated specification and power line should be over than AWG 18(0.75mm²). It may cause a fire or give an electric shock
- 3. Please check the connection before supplying the power. t may cause a fire or give an electric shock, damage to product
- 4. When connecting the unit with power, please install current breaker.
- 5. Please turn off the power when power is failed.
- It may cause human injury or damage to product due to sudden movement when recovering power failure.
- 6. Please supply power after checking control input signal.
- may cause a burn due to high temperature in surface 7. The emergency stop is needed during the operation.
- 8. Please apply power after checking control input signal. may cause human injury or damage to product by sudden movement
- 9. Do not turn on the HOLD OFF signal input while it is maintaining vertical position
- hav cause human injury or damage to product by releasing holding to
- 10. Please install a safety device when it is required to remain the vertical position after turning off the power.
- may cause huma ry or damage to product by releasing holding torque of motor
- 11. Please check if HOLD OFF signal input is ON when it is required to set the output manually.
- It may cause human injury by sudden movement
- 12. Please stop this unit when mechanical problem occurred.
- 13. Do not touch the terminal when measuring insulation resistance and testing insulation dielectric strength.
- *The above specifications are subject to change without notice.

14. Please observe rated specification.

- may cause human injury, electric shock or damage to product
- 15. In cleaning the unit, do not use water or an oil-based detergent.
- may cause a fire or give an electric shock
- 16. Please separate as industrial waste when disusing this unit. 17. Please use the designated 2-phase stepping motor in output part.
 - It may cause a fire or damage to product.

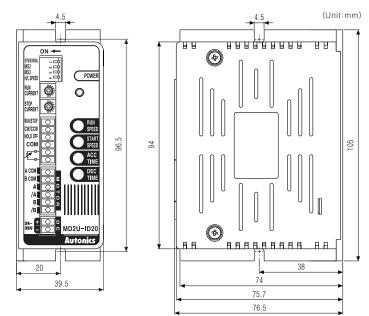

Specifications

Model	MD2U-ID20			
Power supply	24-35VDC			
Allowable voltage range	80 to 120% of rating voltage			
RUN current *1	0.5~2A/Phase			
Current consumption *2	Max. 3A			
RUN method	Unipolar constant current drive			
Maximum speed	1500rpm			
Input resistance	3.3kΩ(CW/CCW, RUN/STOP, HOLD OFF)			
Insulation resistance	Min. 200MΩ (Based on 500VDC of electrification and non-electrification parts)			
Dielectric strength	1000VDC 60Hz for 1 minute (Between electrification and non-electrification parts)			
Noise resistance	±500V the square wave noise(pulse width:1 µs) by the noise simulator			
Vibration	1.5mm amplitude at frequency of 10~55Hz in each of X, Y, Z directions for 2 hours			
Shock	300m/s ² (Approx. 30G) in X, Y, Z directions for 3 times			
Environ Ambient temperature	0 ~ 50°C, Storage: -20 ~ 60°C			
-ment Ambient humidity	35 ~ 85%RH, Storage: 35 ~ 85%RH			
Approval	CE			
Unit weight	Approx. 190g			

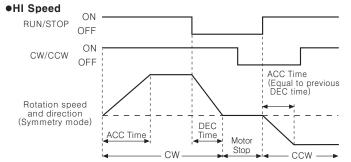

- *1: The max_value of RUN current is based on RMS value in accordance with
- frequency of running motor, peak power can be changed by load fluctuation.

 *2: Ambient temperature is 25[°C] and ambient humidity is 55[%RH]. *Environment resistance is rated at no freezing or condensation

Dimensions

Time charts

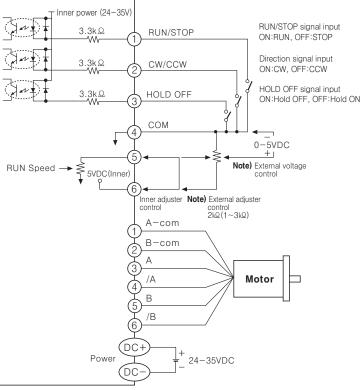

- *It accelerates up to RUN Speed during ACC Time after RUN signal is ON and decelerates during DEC Time after it is OFF.
- *It is not able to change the direction during the signal is ON
- ※It takes 0.5sec for deceleration when DEC Time is "0%"

LOW Speed

Max. RUN speed is 150 rpm and there is no ACC Time / DCC Time section. RUN/STOP and CW/CCW switching can be made in the same way in Hi Speed mode

■ Input • Output diagram

Note) Inner adjuster is correlated to external adjuster control and external voltage control. Make sure that inner adjuster must be set to maximum in order to set maximum Run speed using external adjuster and external voltage.

Functions

○Function DIP Switch

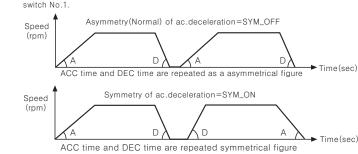

*Reset the power when changing Dip switch.

ON 1 2 3 4	Switch No.	1	2	3	4	Max. speed (rpm)		
	Name	SYM/ASYM (Normal)	MS2	MS3	Hi/Low speed			
	Switch	ON: Symmetry OFF: Asymmetry (Normal)	ON	ON	ON: Hi speed	1500		
			ON	OFF		1350		
			OFF	ON		1000		
			OFF	OFF		500		
		D(%1)	D(%1)	D(%1)	OFF: Low speed	150		

※1: D=Don't care

Selection of Symmetry/Asymmetry

1 A function to make the ACC/DEC time of run-speed as asymmetry or symmetry using Dip

② It is able to set the gradient(acceleration and deceleration time) as ACC/DEC time.

Selection of max. speed (MS2, MS3)

- ① A function to select the maximum speed of motors
- ② The max. speed of stepping motor is changed by MS2/MS3 and Hi/Low speed. 3 The features of run and vibration are able to change depending on MS2, MS3.
- 4 Lower the maximum speed to run a motor smoothly

Selection of Hi/Low speed

- Hi/Low speed switch: Ac.Deceleration control is not available in LS mode since all sections are included in Pull-in range
 LS mode: It is able to drive a motor up to 150rpm of max.drive speed.
- 3 HS mode: It is able to drive a motor up to 1500rpm of max.drive speed.

●RUN current Setting

- RUN current is phase current provided to 2-phase stepping motor. Be sure to set RUN current at the rated current or below. If not, it may cause heat generation, loss of torque or step-out.
- RUN current setting range: 0.5 ~ 2.0A
 RUN current setting: Measure the voltage by connecting a DC voltage meter

motor's running frequency.

- to both CT+ and CT- terminals while the motor is running (Max. 150rpm). Ex)Input Voltage(3V) \times 2 / 3 = 2A(Motor's excitation current) Adjust the RUN current in case severe heat generation occurs.
- Be sure that torque decreasing may occur when adjusting the current. 6 RUN current setting value may have some deviation depending on
- Note)Be sure to adjust RUN current while motor is running

Stop Current Setting

- Stop current is a phase current provided to 2-phase stepping motor at standstill. A function to reduce the current in order to suppress the heat generation at motor standstill / Use variable resistance ratio within 0~100% of RUN current to set STOP current (Actual setting range is 20~70% of RUN current).
- Ex)If RUN current setting value is 2A and STOP current setting value is 0%, STOP current will be set to 0.4A.

 3 STOP current setting value may have some deviation depending on
 - resistance impedance of motor.
 - Auto current down function will be activated when HOLD OFF signal is [L]. When HOLD OFF signal is [H], the function is not activated since the current provided to each phase is cut off.

 Note) Be sure to adjust STOP current while motor is at standstill.

●RUN Speed Setting

It sets max. RUN speed.

Max. RUN speed can be different depending on max. speed setting

(MS2, MS3) and driving mode setting (Hi/Low speed).

Consider motor type and its RUN current when setting Max. RUN speed. Missing step could occur due to max. input pulse frequency of motors. Set the value when the motor stops.

START Speed Setting

X

RUN speed

① It sets desired START speed. ② Max_START speed value is same with RUN speed value.

START speed must be set within maximum starting frequency. It is recommended to set up START speed within 0~50% for stable driving.
 Set the value when the motor stops.

ACC Time Setting

START speed

- It sets the acceleration time from START speed to maximum driving speed.
 AT_1 operation mode when ACC time is under 33.3%, AT_2 operation
- mode when ACC time is under 66.6% and AT_3 operation mode when ACC time is over 66.6%. 3 AT_1 is 0.5 sec. when RUN speed=100%, START speed=0%.
- (a) AT_2 is 1 sec. when RUN speed=100%, START speed=0%. (b) AT_3 is 2 sec. when RUN speed=100%, START speed=0%.
- 6) Set the value when the motor stops

●DEC Time Setting

It sets the deceleration time from maximum RUN speed to STOP. DT_1 operation mode when DEC time is under 33.3%, DT_2 operation mode when DEC time is under 66.6% and DT_3 operation mode when DEC time is over 66.6%

DEC time is over 66.6% § DT_1 is 0.5 sec. when RUN speed=100%, START speed=0%. § DT_2 is 1 sec. when RUN speed=100%, START speed=0%.

DT_3 is 2 sec. when RUN speed=100%, START speed=0% 6 Set the value when the motor stops. *ACC Time and DEC Time are declined in proportion to the setting value of START speed.

*The figures above indicate the factory default for each value EX) In case of DEC Time, 100% is factory default.

Failure diagnosis and management

If motor does not rotate
 Check the connection of controller and driver.

2. If motor rotates as a reverse direction. t is CW rotation when CW/CCW input is [ON] and CCW rotation for [OFF].

If motor does not work properly.

①Check the connection of driver and motor

©Check output current depending on current adjusting switch and current needed to operate motor is correct.

Caution for using

Caution for wiring

Caution for signal input

①It can not be change the direction during the operation

②In case, the signal input supply is higher than rated supply in the specification, please connect the additional resistance to external part.

Caution for setting the RUN and STOP current

A RUN current must be set under a rated current of the motor because motor emits heat too much when a RUN current is set over a rated current of the motor

①Use Twist pair(Over 0.2mm²) for the signal wire should be shorter than 2m. ②Please use an electric wire thicker than the motor lead wire when lengthening the motor wire

connection. 3 Please leave a space over 10cm between a signal wire connection and power wire.

①Keep the heat sink as close as possible to metal panels and place the unit in wellventilated area in order to increase heat protection efficiency of heat sink. @Heat generation may occur on drivers depending on installation environments.

Place the unit with keeping the heat sink under 80°C

Motor vibration and noise can be occurred in specific frequency period.

① Motor vibration and noise can be lowered by change motor installation or attach damper ②Use the unit in a range without vibration and noise range by RUN speed adjustment

Installation environment
(1) It shall be used indoor

②Altitude max. 2000m

♠Installation category II

*It may cause malfunction if above instructions are not followed.
